

Abstract of the Disclosure

Technology is disclosed that allows an immersive video to be transmitted from a first site to a second site using standard television infrastructure. Each frame of the immersive video is packed into at least one standard television frame. The standard television frame is suitable for transmission using standard television infrastructure. Once the standard television frame is received at the second site, the immersive video frame is reconstructed. The reconstructed immersive video frame can then be transmitted, recorded, viewed, or used to generate a view for transmission or recording.
